## ( Differential Equation )

Full Marks: 80

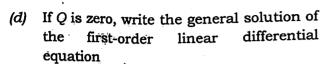

Time: 3 hours

The figures in the margin indicate full marks for the questions

- 1. Answer the following as directed: 1×10=10
  - (a) Write down the degree of the differential equation

$$\frac{dy}{dx} + x = \left(y - x\frac{dy}{dx}\right)^{-3}$$

- (b) What do you mean by singular solution of a differential equation?
- (c) Is the integrating factor of the differential equation x dy y dx = 0 unique?

$$\frac{dy}{dx} + Py = Q$$

where P and Q are the functions of x alone or constant.

(e) Which of the following functions is the solution of the differential equation  $\frac{d^2y}{dx^2} = 0$ ?

(i) 
$$y = 5x$$

$$(ii) \quad y = 5x + 6$$

(iii) 
$$y = e^{5x}$$

(iv) 
$$y = e^{5x} + 6$$

(Choose the correct option)

(f) Write down the particular integral of the differential equation

$$\frac{d^2y}{dx^2} + \frac{dy}{dx} + y = e^{-x}$$

(g) Write down the general solution of the differential equation  $y = px + \frac{2}{p}$ ,

where 
$$p = \frac{dy}{dx}$$
.

(h) Write the differential equation of orthogonal trajectories for a family of curves given by the differential equation

$$f\left(x, y, \frac{dy}{dx}\right) = 0$$

- (i) Write the standard form of the linear partial differential equation of order one.
- (j) Write the conditions for exactness of the total differential equation

$$P(x, y, z)dx + Q(x, y, z)dy + R(x, y, z)dz = 0$$

2. Answer the following questions: 2×5=10

(a) Solve:

$$(x^2-y^2)dx + 2xydy = 0$$

(b) Find the equation of the curve represented by

$$(y-yx)dx + (x+xy)dy = 0$$

and passing through the point (1, 1).

(c) Solve:

$$\frac{d^3y}{dx^3} - 7\frac{dy}{dx} - 6y = 0$$

$$z = (\bar{x}^2 + a)(y^2 + b)$$

where z be a function of two independent variables of x and y.

- (e) If  $8(x+ay+b)^3 = (1+a^3)z^2$  is the complete integral of a partial differential equation  $(p^3+q^3)=27z$ , find its singular integral.
- 3. Answer any four parts:

(a) Prove that necessary and sufficient condition that a differential equation M dx + N dy = 0 be exact is that

$$\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$$

(b) Solve

$$yp^2 + (x-1)p - x = 0$$

where  $p = \frac{dy}{dx}$ .

(c) Find the orthogonal trajectories of the family of curves

$$(x^{2/3} + y^{2/3}) = a^{2/3}$$

where a is parameter.

(Continued)

(d) Solve:

$$x^{2} \frac{d^{2}y}{dx^{2}} - (x^{2} + 2x) \frac{dy}{dx} + (x + 2)y = x^{3}e^{x}$$

(e) Solve:

$$x^2 \frac{d^2y}{dx^2} - 3x \frac{dy}{dx} + 4y = x$$

Given that y=0 when x=1 and  $y=e^2$  when x=e.

(f) Solve:

$$xz^3dx - zdy + 2ydz = 0$$

4. Answer either (a) and (b) or (c) and (d):

- (a) Obtain the equation of the curve whose slope at any point is equal to y+2x and which passes through the origin.
- (b) Solve the following differential equation by reducing it in linear form  $(x-y^2)dx + 2xydy = 0$

Reduce the difference  $y = 2px + yp^2$ 

where  $p = \frac{dy}{dx}$ , to Clairaut's form by substituting  $y^2 = v$  and hence solve the equation.

A9/751

(Turn Over)

(d) Solve:

$$\frac{d^2y}{dx^2} - 2\frac{dy}{dx} + 10y = 0$$

Given that y(0) = 4,  $\frac{dy}{dx} = 1$  at x = 0.

5. Answer either (a) and (b) or (c) and (d):

5+5=10

(a) Reduce the differential equation

$$\frac{d^2y}{dx^2} - 2\tan x \frac{dy}{dx} + 5y = \sec x \cdot e^x$$

to its normal form and hence solve it.

(b) Solve:

$$u dx = (u - 2x) du$$
$$u dy = (ux + uy + 2x - u) du$$

(c) Solve:

$$\sin^2 x \frac{d^2 y}{dx^2} = 2y$$

Given that  $y = \cot x$  is a solution.

(d) Find the necessary condition for integrability of the total differential equation

P(x, y, z)dx + Q(x, y, z)dy + R(x, y, z)dz = 0

A9/751

(Continued)

6. Answer either (a) and (b) or (c) and (d):

5+5=10

(a) Apply variation of parameters to solve the differential equation

$$\frac{d^2y}{dx^2} + y = x$$

(b) Solve:

$$\frac{dx}{mz - ny} = \frac{dy}{nx - lz} = \frac{dz}{ly - mx}$$

(c) Solve

$$\frac{d^2y}{dx^2} + \frac{2}{x}\frac{dy}{dx} + \frac{a^2}{x^4}y = 0$$

by changing the independent variable x to z.

- (d) Form a partial differential equation by eliminating the arbitrary function  $\phi$  from  $\phi(x+y+z, x^2+y^2-z^2)=0$
- 7. Answer either (a) and (b) or (c) and (d): 5+5=10
  - (a) Solve by Lagrange's method

where 
$$p = \frac{\partial z}{\partial x}$$
,  $q = \frac{\partial z}{\partial y}$ .

A9/751

(Turn Over)

(b) Find the complete integral of

$$z^2(p^2z^2+q^2)=1$$

where 
$$p = \frac{\partial z}{\partial x}$$
,  $q = \frac{\partial z}{\partial u}$ .

(c) Solve by Charpit's method

$$z = px + qy + pq$$

where 
$$p = \frac{\partial z}{\partial x}$$
,  $q = \frac{\partial z}{\partial y}$ .

(d) Find the integral surface of the partial differential equation

$$(x^2 - yz) p + (y^2 - zx) q = (z^2 - xy)$$

which passes through the line x = 1, y = 0, where  $p = \frac{\partial z}{\partial x}$ ,  $q = \frac{\partial z}{\partial y}$ .
